Apache Solr
Out Of The Box

Chris Hostetter

2009-11-05

http://lucene.apache.org/solr/
Why Are We Here?

- Learn What Solr Is
- Opening the Box – aka: Getting Started
- Digging Deeper
  - schema.xml
  - solrconfig.xml
- Use Case: Starting from Scratch
- But Wait! There's More!
What Is Solr?
Elevator Pitch

"Solr is an open source enterprise search server based on the Lucene Java search library, with XML/HTTP APIs, caching, replication, and a web administration interface."
What Does That Mean?

- Information Retrieval Application
- Java5 WebApp (WAR) With A Web Services-ish API
- Uses The Java Lucene Search Library
- Healthy And Growing Lucene Sub-Project

**Searching 3 lists and 55,574 messages.** First list started in **January 2006.** There are **3 active lists,** recently accumulating **56 messages per day.** You can browse [recent emails](#).

**Traffic (messages per month):**
Solr In A Nutshell

- Index/Query Via HTTP
- Comprehensive HTML Administration Interfaces
- Scalability - Horizontal and Vertical
- Extensible Plugin Architecture
- Highly Configurable And User Extensible Caching
- Flexible And Adaptable With XML Configuration
  - Customizable Request Handlers And Response Writers
  - Data Schema With Dynamic Fields And Unique Keys
  - Analyzers Created At Runtime From Tokenizers And TokenFilters
Getting Started
The Solr Tutorial

http://lucene.apache.org/solr/tutorial.html

● OOTB Quick Tour Of Solr Basics Using Jetty
● Comes With Example Config, Schema, And Data
● Trivial To Follow Along...

```
cd example
java -jar start.jar

http://localhost:8983/solr/

cd example/exampledocs
java -jar post.jar *.xml```
The Admin Console

Solr Admin (example)
coaster:8983
cwd=/var/tmp/ac-demo/apache-solr-1.4/example SolrHome=solr/

Solr
[SCHEMA] [CONFIG] [ANALYSIS] [SCHEMA BROWSER]

Configuration

schema.xml
● Where You Describe Your Data

solrconfig.xml
● Where You Describe How People Can Interact With Your Data
Loading Data

- Documents Can Be Added, Deleted, Or Replaced
- Canonical Message Transport: HTTP POST
- Canonical Message Format: XML...

```
<add>
  <doc>
    <field name="id">SOLR</field>
    <field name="name">Apache Solr</field>
  </doc>
</add>

<delete><id>SP2514N</id></delete>
<delete><query>name:DDR</query></delete>
```
Querying Data

HTTP GET or POST, params specifying query options...

http://solr/select?q=electronics
http://solr/select?q=electronics&sort=price+desc
http://solr/select?q=electronics&rows=50&start=50
http://solr/select?q=electronics&fl=name+price
http://solr/select?q=electronics&fq=inStock:true
Querying Data: Results

Canonical response format is XML...

<response>
  <lst name="responseHeader">
    <int name="status">0</int>
    <int name="QTime">1</int>
  </lst>
  <result name="response" numFound="14" start="0">
    <doc>
      <arr name="cat">
        <str>electronics</str>
        <str>connector</str>
      </arr>
      <arr name="features">
        <str>car power adapter, white</str>
      </arr>
      <str name="id">F8V7067-APL-KIT</str>
    </doc>
  </result>
</response>
Querying Data: Facet Counts
Querying Data: Facet Counts

Constraint counts can be computed for the whole result set using field values or explicit queries.

```
&facet=true&facet.field=cat&facet.field=inStock
&facet.query=price:[0 TO 10]&facet.query=price:[10 TO */]
```

```
<lst name="facet_counts">
  <lst name="facet_queries">
    <int name="price:[0 TO 10]">0</int>
    <int name="price:[10 TO */]">13</int>
  </lst>
  <lst name="inStock">
    <int name="true">10</int>
    <int name="false">4</int>
  </lst>
</lst>
```
Querying Data: Highlighting

Search: solar power

Search results

Sort by: Relevancy, Title, Type, Author, Date

A Competition Powered by the Sun
Posted on October 08, 2009 at 03:45 PM EDT

I just helped kick-off the Department of Energy’s 2009 Solar Decathlon. This is a unique student competition on the National Mall that showcases the latest energy efficiency and solar power planning, designing, and building high-efficiency, solar-powered homes. I've already met several of them ...
Querying Data: Highlighting

Generates summary "fragments" of stored fields showing matches....

&hl=true&hl.fl=features&hl.fragsize=30

...

<lst name="highlighting">
  <lst name="F8V7067-APL-KIT">
    <arr name="features">
      <str>car power &lt;em&gt;adapter&lt;/em&gt;, white</str>
    </arr>
  </lst>
</lst>

...
Digging Deeper

schema.xml
Describing Your Data

schema.xml is where you configure the options for various fields.

● Is it a number? A string? A date?
● Is there a default value for documents that don't have one?
● Is it created by combining the values of other fields?
● Is it stored for retrieval?
● Is it indexed? If so is it parsed? If so how?
● Is it a unique identifier?
Fields

- `<field>` Describes How You Deal With Specific Named Fields
- `<dynamicField>` Describes How To Deal With Fields That Match A Glob (Unless There Is A Specific `<field>` For Them)
- `<copyField>` Describes How To Construct Fields From Other Fields

```
<field name="title" type="text" stored="false"/>
<dynamicField name="price*" type="sfloat" indexed="true"/>
<copyField source="*" dest="catchall"/>
```
Field Types

- Every Field Is Based On A `<fieldType>` Which Specifies:
  - The Underlying Storage Class (FieldType)
  - The Analyzer To Use Or Parsing If It Is A Text Field
- OOTB Solr Has 18 FieldType Classes

```xml
<fieldType name="sfloat" class="solr.SortableFloatField"
  sortMissingLast="true" omitNorms="true" />
<fieldtype name="string" class="solr.StrField"
  indexed="true" stored="true" />
<fieldtype name="unstored" class="solr.StrField"
  indexed="true" stored="false" />
```
Analyzers

● 'Analyzer' Is A Core Lucene Class For Parsing Text
● Solr Includes 25 Lucene Analyzers That Can Be Used OOTB If They Meet Your Needs

```xml
<fieldType name="text_greek" class="solr.TextField">
  <analyzer
    class="org.apache.lucene.analysis.el.GreekAnalyzer"/>
</fieldType>
```

...BUT WAIT!
Tokenizers And TokenFilters

- **Analyzers Are Typical Comprised Of Tokenizers And TokenFilters**
  - **Tokenizer**: Controls How Your Text Is Tokenized
  - **TokenFilter**: Mutates And Manipulates The Stream Of Tokens

- **Solr Lets You Mix And Match Tokenizers and TokenFilters In Your schema.xml To Define Analyzers On The Fly**

- **OOTB Solr Has Factories For 17 Tokenizers and 45 TokenFilters**

- **Many Factories Have Customization Options -- Limitless Combinations**
Tokenizers And TokenFilters

```xml
<fieldType name="text" class="solr.TextField">
  <analyzer type="index">
    <tokenizer class="solr.WhitespaceTokenizerFactory"/>
    <filter class="solr.StopFilterFactory">
      words="stopwords.txt"/
    </filter>
    <filter class="solr.WordDelimiterFilterFactory">
      generateWordParts="1" generateNumberParts="1"/
    </filter>
    <filter class="solr.LowerCaseFilterFactory"/>
    <filter class="solr.EnglishPorterFilterFactory">
      protected="protwords.txt"/
    </filter>
  </analyzer>
  <analyzer type="query">
    <tokenizer class="solr.WhitespaceTokenizerFactory"/>
    <filter class="solr.SynonymFilterFactory">
      synonyms="synonyms.txt" expand="true"/
    </filter>
  </analyzer>
</fieldType>
```
Notable Tokenizers/Filters

- StandardTokenizerFactory
- WhitespaceTokenizerFactory
- KeywordTokenizerFactory
- NGramTokenizerFactory
- PatternTokenizerFactory
- EnglishPorterFilterFactory
- SynonymFilterFactory
- StopFilterFactory
- ASCIIFilterFactory
- PatternReplaceFilterFactory
Analysis Tool

● HTML Form Allowing You To Feed In Text And See How It Would Be Analyzed For A Given Field (Or Field Type)

● Displays Step By Step Information For Analyzers Configured Using Solr Factories...
  ■ Token Stream Produced By The Tokenizer
  ■ How The Token Stream Is Modified By Each TokenFilter
  ■ How The Tokens Produced When Indexing Compare With The Tokens Produced When Querying

● Helpful In Deciding Which Tokenizer/TokenFilters You Want To Use For Each Field Based On Your Goals
Analysis Tool: Output

Digging Deeper

solrconfig.xml
Interacting With Your Data

solrconfig.xml is where you configure options for how this Solr instance should behave.

- Low-Level Index Settings
- Performance Settings (Cache Sizes, etc...)
- Types of Updates Allowed
- Types of Queries Allowed

Note:

- solrconfig.xml depends on schema.xml.
- schema.xml does not depend on solrconfig.xml.
Request Handlers

● Type Of Request Handler Determines Options, Syntax, And Logic For Processing Requests

● OOTB Indexing Handlers:
  ■ XmlUpdateRequestHandler
  ■ CSVRequestHandler
  ■ DataImportHandler

● OOTB Searching Handler:
  ■ SearchHandler + QParsers
Indexing Message Transports

- Request Handlers Deal Abstractly With "Content Streams"
- Several Ways To Feed Data To Solr As A Content Stream...
  - Raw HTTP POST Body
  - HTTP Multipart "File Uploads"
  - Read From Local File
  - Read From Remote URL
  - URL Param String
SearchHandler

- SearchHandler executes query with filtering, pagination, return field list, highlighting, faceting, etc...
- Uses a QParser to parse query string
- OOTH Solr provides two great QParsers you can use depending on your needs

```xml
&defType=lucene (Default)
&defType=dismax
```
**LuceneQParserPlugin**

- Main Query String Expressed In The "Lucene Query Syntax"
- Clients Can Search With Complex "Boolean-ish" Expressions Of Field Specific Queries, Phrase Queries, Range Queries, Wildcard And Prefix Queries, Etc...
- Queries Must Parse Cleanly, Special Characters Must Be Escaped

?q=name:solr+%2B(cat:server+cat:search)+popular:[5+TO+*]
?q=name:solr^2+features:"search+server"~2
?q=features:scal*
LuceneQParserPlugin

q = name:solr + (cat:server cat:search) popular:[5 TO *]
q = name:solr^2 features:"search server"~3
q = features:scal*

Good for situations where you want to give smart users who understand both the syntax and the fields of your index the ability to search for very specific things.
DisMaxQP parser plugin

- Main Query String Expressed As A Simple Collection Of Words, With Optional "Boolean-ish" Modifiers
- Other Params Control Which Fields Are Searched, How Significant Each Field Is, How Many Words Must Match, And Allow For Additional Options To Artificially Influence The Score
- Does Not Support Complex Expressions In The Main Query String

?q=%2Bsolr+search+server&qf=features+name^2&bq=popular:[5+TO+*]
DisMaxQParserPlugin

\[ q = +\text{solr search server} \]
\[ & \ qf = \text{features name}^2 \]
\[ & \ bq = \text{popular:}[5 \ TO \ *) \]

Good for situations when you want to pass raw input strings from novice users directly to Solr.
QPParser For Other Params?

- By Default Other Query Params Use LuceneQPParser
- Prefix Notation Exists To Override This, And Customize Behavior

\&bq={!dismax qf=desc^2,review}cheap
\&fq={!lucene df=keywords}lucene solr java
Request Handler Configuration

● Multiple Instances Of Various RequestHandlers, Each With Different Configuration Options, Can Be Specified In Your solrconfig.xml

● Any Params That Can Be Specified In A URL, Can Be "Baked" Into Your solrconfig.xml For A Particular RequestHandler Instance

● Options Can Be:
  ■ "defaults" Unless Overridden By Query Params
  ■ "appended" To (Multi-Valued) Query Params
  ■ "invariants" That Suppress Query Params

http://solr/select?q=ipod
http://solr/simple?q=ipod
http://solr/complex?q=ipod
Example: Handler Configuration

```xml
<requestHandler name="/select" class="solr.SearchHandler" />
<requestHandler name="/simple" class="solr.SearchHandler" >
  <lst name="defaults">
    <str name="defType">dismax</str>
    <str name="qf">catchall</str>
  </lst>
</requestHandler>

<requestHandler name="/complex" class="solr.SearchHandler" >
  <lst name="defaults">
    <str name="defType">dismax</str>
    <str name="qf">features^1 name^2</str>
  </lst>
  <lst name="appends">
    <str name="fq">inStock:true</str>
  </lst>
  <lst name="invariants">
    <str name="facet">false</str>
  ...
```
Output: Response Writers

- Response Format Can Be Controlled Independently From Request Handler Logic
- Many Useful Response Writers OOTB

http://solr/select?q=electronics
http://solr/select?q=electronics&wt=xml
http://solr/select?q=electronics&wt=json
http://solr/select?q=electronics&wt=python
http://solr/select?q=electronics&wt=ruby
http://solr/select?q=electronics&wt=php
http://solr/select?q=electronics&wt=xslt&tr=example.xsl

```
<queryResponseWriter name="xml" default="true"
    class="solr.XMLResponseWriter"/>
```
Use Case

Starting From Scratch
Installing Solr

● Put The solr.war Where Your Favorite Servlet Container Can Find It
● Create A "Solr Home" Directory
● Steal The Example solr/conf Files
● Point At Your Solr Home Using Either:
  ■ JNDI
  ■ System Properties
  ■ The Current Working Directory

(Or just use the Jetty example setup.)
Example: Tomcat w/JNDI

```xml
<Context docBase="f:/solr.war"
    debug="0"
    crossContext="true" >
    <Environment name="solr/home"
        value="f:/my/solr/home"
        type="java.lang.String"
        override="true" />
</Context>
```
Minimalist Schema

```xml
<schema name="minimal" version="1.1">
  <types>
    <fieldType name="string" class="solr.StrField"/>
  </types>
  <fields>
    <dynamicField name="*" type="string" indexed="true" stored="true"/>
  </fields>
  <!-- A good idea, but not strictly necessary -->
  <uniqueKey>id</uniqueKey>
  <defaultSearchField>catchall</defaultSearchField>
</schema>
```
Feeding Data From The Wild

- I Went Online And Found A CSV File Containing Data On Books
- Deleted Some Non UTF-8 Characters
- Made Life Easier For Myself By Renaming The Columns So They Didn't Have Spaces

```bash
curl 'http://solr/update/csv?commit=true'
  -H 'Content-type:text/plain; charset=utf-8'
  --data-binary @books.csv
```
Understanding The Data: Luke

- The LukeRequestHandler is based on a popular Lucene GUI app for debugging indexes (Luke).
- Allows introspection of field information:
  - Options from the schema (either explicit or inherited from field type)
  - Statistics on unique terms and terms with high doc frequency
  - Histogram of terms with doc frequency above set thresholds
- Helpful in understanding the nature of your data
- Schema browser: Luke on steroids
Example: Luke Output

```xml
+<lst name="reviews">
  - <lst name="publisher">
    <str name="type">string</str>
    <str name="schema">I-S-------</str>
    <str name="index">I-S-------</str>
    <int name="docs">854</int>
    <int name="distinct">2</int>
  - <lst name="topTerms">
    <int name="Hart Publishing">666</int>
    <int name="Intersentia">188</int>
  </lst>
  - <lst name="histogram">
    <int name="2">0</int>
    <int name="4">0</int>
    <int name="8">0</int>
    <int name="16">0</int>
    <int name="32">0</int>
    <int name="64">0</int>
    <int name="128">0</int>
    <int name="256">1</int>
    <int name="512">0</int>
    <int name="1024">1</int>
  </lst>
</lst>
```

```
47
```

ApacheCon US 2009

</tbody>
</table>

**Histogram**
Refining Your Schema

● Pick Field Types That Make Sense
● Pick Analyzers That Make Sense
● Use `<copyField>` To Make Multiple Copies Of Fields For Different Purposes:
  ■ Faceting
  ■ Sorting
  ■ Loose Matching
  ■ Etc...
Example: "BIC" Codes

<!-- used by the bic field, a prefix based code -->

<fieldType name="bicgram" class="solr.TextField">
   <analyzer type="index">
      <tokenizer class="solr.EdgeNGramTokenizerFactory"
         minGramSize="1"
         maxGramSize="100"
         side="front"/>
      <filter class="solr.LowerCaseFilterFactory"/>
   </analyzer>
   <analyzer type="query">
      <tokenizer class="solr.WhitespaceTokenizerFactory"/>
      <filter class="solr.LowerCaseFilterFactory"/>
   </analyzer>
</fieldType>
But Wait!

There's More!
Builds and incrementally updates indexes based on configured SQL or XPath queries.

```xml
<entity name="item" pk="ID" query="select * from ITEM"
    deltaQuery="select ID ... where
                ITEMDATE > '${dataimporter.last_index_time}'>"
    <field column="NAME" name="name" />
...
<entity name="f" pk="ITEMID"
    query="select DESC from FEATURE where ITEMID='${item.ID}''"
    deltaQuery="select ITEMID from FEATURE where
                UPDATEDATE > '${dataimporter.last_index_time}''"
    parentDeltaQuery=""
    select ID from ITEM where ID=${f.ITEMID}''">
    <field name="features" column="DESC" />
...
```
ExtractingRequestHandler

● Aka: “Solr Cell”

● Uses Tika to Parse Binary & Rich Content Documents
  ■ HTML
  ■ PDF
  ■ MS-Word
  ■ MP3

● Maps Tika Output Fields To Solr Schema Fields

● Supports XPath Filtering Of The Generated DOM
Search Components

- Default Components That Power SearchHandler
  - QueryComponent
  - HighlightComponent
  - FacetComponent
  - MoreLikeThisComponent
  - StatsComponent
  - DebugComponent

- Additional Components You Can Configure
  - SpellCheckComponent
  - QueryElevationComponent
  - TermsComponent
  - TermVectorComponent
  - ClusteringComponent
Score Explanations

- Why Did Document X Score Higher Than Y?
- Why Didn't Document Z Match At All?
- Debugging Options Can Answer Both Questions...
  - idf - How Common A Term Is In The Whole Index
  - tf - How Common A Term Is In This Document
  - fieldNorm - How Significant Is This Field In This Document (Usually Based On Length)
  - boost - How Important The Client Said This Clause Is
  - coordFactor - How Many Clauses Matched

&debugQuery=true&explainOther=documentId-Z
Example: Score Explanations

<str name="id=9781841135779,internal_docid=111">
0.30328625  = (MATCH) fieldWeight(catchall:law in 111),
product of:
   3.8729835  = tf(termFreq(catchall:law)=15)
   1.0023446  = idf(docFreq=851)
   0.078125   = fieldNorm(field=catchall, doc=111)
</str>
...

<str name="id=9781841135335,internal_docid=696">
0.26578674  = (MATCH) fieldWeight(catchall:law in 696),
product of:
   4.2426405  = tf(termFreq(catchall:law)=18)
   1.0023446  = idf(docFreq=851)
   0.0625     = fieldNorm(field=catchall, doc=696)
</str>
...
Multiple Indexes

Using a solr.xml file, you can configure Solr to manage several different indexes.

```xml
<solr persistent="true" sharedLib="lib">
  <cores adminPath="/core-admin/">
    <core name="books" instanceDir="books" />
    <core name="games" instanceDir="games" />
    ...
  </cores>
</solr>
```

The CoreAdminHandler lets you create, reload and swap indexes on the fly.

```
/core-admin?action=RELOAD&core=books
/core-admin?action=CREATE&name=books2&instanceDir=books2
/core-admin?action=SWAP&core=books&other=books2
```
Replication

ReplicationHandler for efficiently mirroring an index on multiple machines

```xml
<requestHandler name="/replication"
    class="solr.ReplicationHandler">
    <lst name="master">
        <str name="replicateAfter">commit</str>
    </lst>
</requestHandler>
...

<requestHandler name="/replication"
    class="solr.ReplicationHandler">
    <lst name="slave">
        <str name="masterUrl">
            http://master:8080/solr/replication
        </str>
        <str name="pollInterval">00:00:60</str>
    </lst>
</requestHandler>
...
Distributed Searching

- Options For Aggregating Results From Multiple Solr “Shards”
- Handy When “Index” Is Too Big For One Machine
- Most Core Features Supported:
  - Basic Queries
  - Highlighting
  - Faceting

?q=ipod

?shards=host1:8983/solr,host2:7574/solr
Questions?

http://lucene.apache.org/solr/
